

INTERNAL PRODUCT BRIEF

QuotelQ Insurance Quotation Intelligence Platform

POC / MVP concept for an insurance sales pipeline and quotation control tower. Built for Botswana. Built to scale across SADC.

Prepared for: Kabo, Andrew, Thomas & Kwaku

Date: May 2026

Status: Working draft for team review

WHY THIS MATTERS

From quote tracking to sales intelligence.

This is not a request to build a database. It is an opening to solve a commercially important problem: the insurer needs a cleaner way to know what was quoted, what converted, what was lost, why it was lost, and where sales effort or management intervention should be focused.

Working thesis

Build a lightweight quotation intelligence platform that gives Sales, Relationship Managers, Underwriting, and Management real-time visibility of quote pipeline, turnaround times, follow-up discipline, conversion rates, lost business reasons, and broker performance.

Revenue CLOSE TO PREMIUM GROWTH	90 days TO A WORKING MVP	Reusable ACROSS INSURERS & BROKERS	AI-ready ONCE DATA ACCUMULATES
---	--	--	--

Strategic positioning

- Position this as a Sales Quote Control Tower, not simply a quote register.
- Anchor the value around premium visibility, quote conversion, broker performance, follow-up discipline, and lost business intelligence.
- Start focused and practical: quote capture, workflow, reminders, dashboards, and loss reasons. Add AI and integrations after the workflow proves value.
- Use this as a repeatable product wedge for insurance and adjacent B2B sales environments in Botswana and the SADC region.

SOURCE BASIS

What the loose requirements already tell us.

The uploaded client brief is already commercially useful. It asks for end-to-end quotation tracking, pipeline visibility, partner/RM analytics, turnaround analysis, and escalation of high-value or stalled opportunities. That gives us a strong product wedge from day one.

Area	Current requirement
Core objective	End-to-end tracking, real-time pipeline status, partner/RM analytics, trend and turnaround analysis, escalation of high-value or stalled opportunities.
Mandatory data capture	Client/prospect, partner/broker, RM, request channel, dates received/prepared/sent, product, cover type, quoted premium, status, decision date, and lost reason.
Workflow	Request Received -> Quote Prepared -> Quote Sent -> Follow-Up / Pending -> Closed Won or Lost.

Area	Current requirement
System rules	Auto-calculate request-to-quote and quote-to-decision turnaround; timestamp status changes; require lost reason when marked Lost.
Analytics	Quote volume by partner/RM/product, conversion/hit ratio, turnaround performance, and closure performance.

Important framing

The brief is operational on the surface, but strategic underneath. It touches revenue leakage, broker productivity, pricing insight, sales discipline, and management visibility.

PRODUCT CONCEPT

QuotelQ: a quotation intelligence control tower.

The first version should feel simple to use, but strategically rich in what it reveals. It should help the insurer act on opportunities while they are still alive, not only report on them after they are lost.

Dimension	Definition
Primary users	Head of Sales & Business Development, Relationship Managers, Underwriters, Management/ExCo viewers, and Sales Operations/Admin.
Core job to be done	Capture every quote request, track it through the lifecycle, prompt follow-up, and convert operational activity into commercial insight.
Primary business value	Improve quote follow-up, reduce premium leakage, expose reasons for lost business, and identify which brokers/RMs/products are driving value.
First product wedge	A working MVP for one insurer, one sales team, and selected products or broker channels.
Future product opportunity	A reusable insurance sales intelligence platform for insurers, brokers, medical aid, and other B2B financial services environments.

COMMERCIAL LENS

What the Head of Sales needs to know every week.

For Sales, the system only matters if it helps answer questions that change behaviour, prioritisation, coaching, or broker engagement.

Sales question	QuotelQ answer
What have we quoted?	All quotes by client, broker, RM, product, premium value, date received, and current status.
What is still open?	Open/pending quotes, aging, next follow-up date, owner, premium at risk, and escalation flags.
What did we win?	Won quotes by RM, broker, product, client segment, and premium converted.
What did we lose?	Lost quotes by reason: pricing, incumbent, tender exercise, brand trust, coverage gaps, service concerns, and other.
Where should we intervene?	High-value stalled quotes, overdue follow-ups, slow turnaround, brokers with poor conversion, and products with recurring losses.

RECOMMENDED AUGMENTATIONS

What we should add beyond the first brief.

The current requirements are a good start. The additions below turn the idea from a tracker into a decision platform for sales, underwriting, broker management, and executive reporting.

Area	Add / improve	Why it matters
------	---------------	----------------

Area	Add / improve	Why it matters
Opportunity value	Estimated annual premium, policy term, potential lifetime value, expected commission/broker fee, and new vs renewal.	Prioritises high-value opportunities instead of treating every quote the same.
Client segmentation	Client type, industry, segment, region, existing/new client, and strategic account flag.	Creates useful market and sales strategy insight.
Product segmentation	Product group and line: motor, property, liability, engineering, marine, group life, health, funeral, etc.	Shows where the insurer converts, loses, or takes too long.
Richer lifecycle	Awaiting Underwriting, Awaiting Client Info, Awaiting Broker Feedback, Follow-Up Due, Escalated, Quote Expired.	Reflects real insurance workflows better than simple Open/Pending/Closed.
Follow-up management	Last follow-up date, next follow-up date, follow-up count, follow-up notes, and reminder alerts.	Moves the tool from passive reporting to active sales execution.
Escalation rules	Flag high-value, stale, expired, delayed, and no-follow-up quotes.	Directs management attention to premium at risk.
Loss intelligence	Competitor won, competitor premium if known, price difference, coverage gap notes, and loss commentary.	Creates pricing, proposition, service, and broker insight.
Broker analytics	Broker tier, broker branch, contact person, conversion rate, premium won, average turnaround, and loss reasons.	Separates productive partners from market-shopping brokers.
Underwriting SLA	Underwriting owner, date assigned, date returned, SLA status, and reason for delay.	Makes delays visible and helps Sales and Underwriting collaborate.
Document control	Quote document upload, quote version, quote reference number, and quote valid-until date.	Avoids confusion and supports auditability.

MVP SCOPE

Keep the first build narrow, polished, and useful.

The MVP should prove the workflow and the management insight. It does not need heavy integrations at the start. It needs clean data capture, an intuitive pipeline, reminders, and dashboards that leadership will actually use.

Feature	Timing	Notes
User login and roles	MVP	Admin, Sales Head, RM, Underwriter, Executive Viewer.
Quote capture form	MVP	Use mandatory fields plus a small set of value and segmentation fields.
Quote lifecycle workflow	MVP	Request Received -> Assigned -> Quote Prepared -> Quote Sent -> Follow-Up -> Won/Lost.
Pipeline view	MVP	Filter by RM, broker, product, status, aging, and premium value.
Follow-up reminders	MVP	Overdue follow-ups and quote expiry alerts.
Lost reason capture	MVP	Mandatory structured reason, with optional comments.
Dashboards	MVP	Executive, Sales, RM, Broker, Product, Loss Reason, and Turnaround dashboards.
Document uploads	MVP / 1.1	Useful but can be simplified in early build.
Email integration	Phase 2	Avoid unless needed for pilot. Adds complexity.
WhatsApp integration	Phase 2	Valuable in Botswana context, but requires governance and consent.
Core system integration	Phase 2/3	Integrate after workflow and value are proven.
AI predictions	Phase 3	Requires sufficient historical quote data first.

POC DEMO JOURNEY

The three journeys we should show first.

The POC should be visually convincing and operationally believable. We should demonstrate that we understand the real sales workflow, not just the UI.

Step	Demo moment	What the team should build
01 Discover	Capture a quote request	A user enters client, broker, RM, product, premium estimate, date received, and request channel.
02 Design	Move it through workflow	The quote is assigned, prepared, sent, followed up, and either won or lost with a mandatory reason.
03 Build	Show the control tower	Dashboards reveal open premium at risk, stalled quotes, RM performance, broker conversion, turnaround, and top loss reasons.

POC success standard

After 10 minutes, the MD and Head of Sales should be able to say: "If we had this, we would immediately know where our quote pipeline stands, where premium is leaking, and who needs to act."

CORE DATA MODEL

Minimum fields to make the insight credible.

The first build should avoid unnecessary complexity, but must capture enough detail to support meaningful sales and management reporting.

Category	Fields
Request origin	Quote ID, client/prospect, partner/broker, broker contact, RM, request channel, date received.
Client profile	Client type, industry, existing/new client, segment, strategic flag, region.
Quote details	Product, line of business, type of cover, sum insured, premium quoted, quote expiry date.
Process tracking	Date assigned, underwriting owner, date quote prepared, date quote sent, turnaround days.
Follow-up	Last follow-up date, next follow-up date, follow-up count, follow-up notes.
Outcome	Status, decision date, bound premium, lost reason, competitor if known, loss comments.
Governance	Created by, updated by, timestamp trail, attachments, quote version, audit log.

DASHBOARD VIEWS

What management should see at a glance.

The dashboard is where the product becomes strategic. It converts operational quote data into sales management decisions.

Dashboard	Primary insight
Executive Overview	Total quotes, quoted premium, won premium, lost premium, open premium at risk, hit ratio, average turnaround.
Pipeline Aging	Open quotes by age bucket: 0-3 days, 4-7 days, 8-14 days, 15+ days; split by premium value.
Broker Performance	Quote volume, conversion rate, won premium, average turnaround, top loss reason by broker.
RM Performance	Quotes handled, conversion rate, overdue follow-ups, average turnaround, won premium.
Loss Analysis	Lost premium by reason: pricing, incumbent, tender, trust, coverage gaps, service concerns, other.
SLA / Turnaround	Request-to-quote time, quote-to-decision time, underwriting time, SLA breaches.
Escalation Queue	High-value stalled quotes, expired quotes, overdue follow-ups, and quotes awaiting underwriting beyond SLA.

BUILD APPROACH

Fast, practical, and adoption-led.

The first version should embody The Brittany approach: discover the specific pain, prototype quickly, build in small sprints, deploy properly, and improve with the client.

Phase	What happens
Discover	Run 2-3 working sessions with Sales, RMs, Underwriting, and Management. Map the current quote journey, data sources, handoffs, and pain points.
Design	Create wireframes and a clickable prototype with realistic sample data. Validate the screens before writing too much code.
Build	Build the workflow, data model, dashboards, roles, reminders, and exports in short weekly sprints.
Deploy	Pilot with one team/product line/broker channel. Train users, set up roles, and agree weekly reporting cadence.
Optimise	Review usage, clean data definitions, refine dashboards, and decide on integrations or AI additions based on real usage.

Suggested 90-day MVP path

Period	Focus	Outputs
Weeks 1-2	Discovery and workflow mapping	Confirm fields, personas, statuses, dashboards, SLA rules, pilot scope, and data governance.
Weeks 3-4	Prototype and approval	Clickable prototype, sample dashboard, client walkthrough, and agreed MVP backlog.
Weeks 5-8	Core build	Quote capture, pipeline, workflow, user roles, reminders, exports, and basic dashboard views.
Weeks 9-10	Pilot data and testing	Import sample/live quote data, test workflows, refine validations, and prepare training.

Period	Focus	Outputs
Weeks 11-12	Pilot launch	Go live with selected users, monitor adoption, fix priority issues, and publish first management report.

TECHNICAL CONSIDERATIONS

Decisions for Andrew, Thomas, and Kwaku to pressure-test.

The MVP should be robust enough to pilot with a real client, while staying light enough to ship quickly.

Area	Consideration
Architecture option	Low-code front end + database + BI dashboard vs custom web app. Recommendation: choose speed for POC, but keep data model portable.
Data storage	Structured relational database with quote, client, broker, product, status history, follow-up, and attachment tables.
Authentication	Role-based access from day one. Keep executive viewers read-only.
Auditability	Timestamp status changes and field updates. This is important for trust and management reporting.
Exports	Excel and PDF exports for weekly sales meetings and ExCo-style reporting.
Integrations	Defer email/core system integration unless the client makes it a pilot condition.
AI readiness	Design fields cleanly so future AI can predict win probability, suggest next action, cluster brokers, and identify pricing leakage.
Data protection	Treat client/prospect data as sensitive. Agree retention, access, and hosting approach before pilot.

ADOPTION RISKS

The biggest risk is not technical.

The key risk is user adoption. RMs may see the platform as a policing tool unless it is positioned as a way to win more business, protect pipeline value, and get management support where needed.

Risk	Mitigation
RM resistance	Position as a sales support and revenue protection tool, not a surveillance tool. Keep capture easy.
Poor data quality	Use dropdowns, mandatory fields, validation, and simple definitions. Do not over-customise free text fields.
Workflow complexity	Start with the real minimum workflow, then add nuance after observing pilot usage.
Leadership loses interest	Create a sharp weekly dashboard that makes decisions visible and repeatable.
Integration drag	Avoid allowing integrations to delay value. Start standalone and prove the management insight.
Misaligned ownership	Agree who owns quote updates at each stage: RM, Sales Admin, or Underwriting.

Open questions for the client

- Which products/lines of business should the pilot cover first?
- Who currently owns each stage of the quote lifecycle?
- What turnaround SLAs are expected by product or channel?
- What premium threshold should trigger escalation?
- How are quotes currently prepared, stored, and referenced?
- What reports does the Head of Sales currently prepare manually?
- Which broker/partner information is already available?
- What is the preferred hosting/security posture for a pilot?

INTERNAL ASK

What we need from The Brittany team.

The immediate goal is not to build everything. It is to align on a credible POC/MVP approach and decide what we can show quickly to validate the opportunity.

Team lens	Question to answer
Product thinking	Refine the user journeys, field list, dashboard hierarchy, and adoption approach.
Engineering thinking	Recommend the fastest credible technical stack and architecture for POC and MVP.
Operations thinking	Think through onboarding, data capture discipline, training, support, and weekly reporting cadence.
Commercial thinking	Estimate effort, pricing model, pilot terms, and how this could become a reusable product.

Decision needed

Do we agree this is a strong first wedge for The Brittany? If yes, the next move is to create a polished POC with sample insurance quote data and a management dashboard we can use to reopen the conversation with the Head of Sales and MD.
